What is a sealless magnetic drive pump?

A sealless mag drive pump is a conventional centrifugal pump without the dynamic seal that would normally be used to seal the pump shaft. This dynamic seal is replaced by a static containment shell to form a completely sealed liquid end or pressure boundary.

Sealless centrifugal pumps with magnetic drive have been around the industry for 70 years now. They offer plant engineering contractors and operators a 100% leakage free pump associated with the highest operational safety, low maintenance and adherence to strict environmental standards. As a matter of fact, mag drive pumps are displacing centrifugal pumps with double mechanical seal as they have proved to be a greater cost-effective solution for hard-to-seal applications and the handling of hazardous, volatile and aggressive chemicals.

Want to know the reasons to choose a sealless magnetic drive pump vs a mechanical seal pump?
